

**4-(2-Phenylsulfanyl-phenyl)-piperidine derivatives as serotonin reuptake inhibitors**

The present invention relates to novel compounds which are serotonin reuptake 5 inhibitors and as such effective in the treatment of for example depression and anxiety.

**Background of the invention**

10 Selective serotonin reuptake inhibitors (hereinafter referred to as SSRIs) have become first choice therapeutics in the treatment of depression, certain forms of anxiety and social phobias, because they are effective, well tolerated and have a favourable safety profile compared to the classic tricyclic antidepressants.

15 However, clinical studies on depression indicate that non-response to SSRIs is substantial, up to 30%. Another, often neglected, factor in antidepressant treatment is compliance, which has a rather profound effect on the patient's motivation to continue pharmacotherapy.

20 First of all, there is the delay in therapeutic effect of SSRIs. Sometimes symptoms even worsen during the first weeks of treatment. Secondly, sexual dysfunction is a side effect common to all SSRIs. Without addressing these problems, real progress in the pharmacotherapy of depression and anxiety disorders is not likely to happen.

25 In order to cope with non-response, psychiatrists sometimes make use of augmentation strategies. Augmentation of antidepressant therapy may be accomplished through the co-administration of mood stabilizers such as lithium carbonate or triiodothyronine or by the use of electroshock.

30 The effect of combined administration of a compound that inhibits serotonin reuptake and a 5-HT<sub>1A</sub> receptor antagonist has been evaluated in several studies (Innis *et al.* *Eur. J. Pharmacol.* 1987, 143, 1095-204 and Gartside *Br. J. Pharmacol.* 1995, 115, 1064-1070, Blier *et al.* *Trends in Pharmacol. Science* 1994, 15, 220). In these

studies, it was found that 5-HT<sub>1A</sub> receptor antagonists would abolish the initial brake on 5-HT neurotransmission induced by the serotonin reuptake inhibitors and thus produce an immediate boost of 5-HT transmission and a rapid onset of therapeutic action.

5

Several patent applications have been filed, which cover the use of a combination of a 5-HT<sub>1A</sub> antagonist and a serotonin reuptake inhibitor for the treatment of depression (see e.g. EP-A2-687472 and EP-A2-714663).

10 Another approach to increase terminal 5-HT would be through blockade of the 5-HT<sub>1B</sub> autoreceptor. Microdialysis experiments in rats have indeed shown that increase of hippocampal 5-HT by citalopram is potentiated by GMC 2-29, an experimental 5-HT<sub>1B</sub> receptor antagonist.

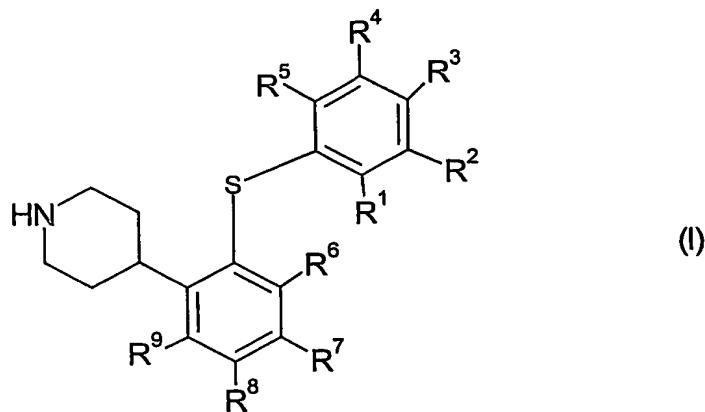

15 Several patent applications covering the combination of an SSRI and a 5-HT<sub>1B</sub> antagonist or partial agonist have also been filed (WO 97/28141, WO 96/03400, EP-A-701819 and WO 99/13877).

It has previously been found that the combination of a serotonin reuptake inhibitor  
20 with a compound having 5-HT<sub>2C</sub> antagonistic or inverse agonistic effect (compounds having a negative efficacy at the 5-HT<sub>2C</sub> receptor) provides a considerable increase in the level of 5-HT in terminal areas, as measured in microdialysis experiments (WO 01/41701). This would imply a shorter onset of antidepressant effect in the clinic and an augmentation or potentiation of the therapeutic effect of the serotonin reuptake  
25 inhibitor (SRI).

The present invention provides compounds which are serotonin reuptake inhibitors for the treatment of affective disorders, such as depression, anxiety disorders including general anxiety disorder, social anxiety disorder, post traumatic stress disorder,  
30 obsessive compulsive disorder, panic disorder, panic attacks, specific phobias, social phobia and agoraphobia. Some of the compounds also have a combined effect of serotonin reuptake inhibition and 5-HT<sub>2C</sub> receptor modulation, which according to WO01/41701 would imply a faster onset of antidepressant activity.

### **Pharmaceutical compositions**

15       The compounds of the invention may be administered alone or in combination with pharmaceutically acceptable carriers or excipients, in either single or multiple doses.

The pharmaceutical compositions according to the invention may be formulated with pharmaceutically acceptable carriers or diluents as well as any other known adjuvants and excipients in accordance with conventional techniques such as those disclosed in the textbook *Remington: The Science and Practice of Pharmacy*, 19 Edition, Gennaro, 5 Ed., Mack Publishing Co., Easton, PA, 1995.

The pharmaceutical compositions may be specifically formulated for administration by any suitable route such as the oral, rectal, nasal, pulmonary, topical (including buccal and sublingual), transdermal, intracisternal, intraperitoneal, vaginal and 10 parenteral (including subcutaneous, intramuscular, intrathecal, intravenous and intradermal) route, the oral route being preferred. It will be appreciated that the preferred route will depend on the general condition and age of the subject to be treated, the nature of the condition to be treated and the active ingredient chosen. Pharmaceutical compositions for oral administration include solid dosage forms such 15 as capsules, tablets, dragees, pills, lozenges, powders and granules. Where appropriate, they can be prepared with coatings such as enteric coatings or they can be formulated so as to provide controlled release of the active ingredient such as sustained or prolonged release according to methods well known in the art.

20 Liquid dosage forms for oral administration include solutions, emulsions, suspensions, syrups and elixirs.

Pharmaceutical compositions for parenteral administration include sterile aqueous and 25 nonaqueous injectable solutions, dispersions, suspensions or emulsions as well as sterile powders to be reconstituted in sterile injectable solutions or dispersions prior to use. Depot injectable formulations are also contemplated as being within the scope of the present invention.

30 Other suitable administration forms include suppositories, sprays, ointments, cremes, gels, inhalants, dermal patches, implants etc.

A typical oral dosage is in the range of from about 0.001 to about 100 mg/kg body

weight per day, preferably from about 0.01 to about 50 mg/kg body weight per day, and more preferred from about 0.05 to about 10 mg/kg body weight per day administered in one or more dosages such as 1 to 3 dosages. The exact dosage will depend upon the frequency and mode of administration, the sex, age, weight and general condition of the subject treated, the nature and severity of the condition treated and any concomitant diseases to be treated and other factors evident to those skilled in the art.

The formulations may conveniently be presented in unit dosage form by methods known to those skilled in the art. A typical unit dosage form for oral administration one or more times per day such as 1 to 3 times per day may contain from 0.01 to about 1000 mg, preferably from about 0.05 to about 500 mg, and more preferred from about 0.5 mg to about 200 mg.

For parenteral routes such as intravenous, intrathecal, intramuscular and similar administration, typically doses are in the order of about half the dose employed for oral administration.

The compounds of this invention are generally utilized as the free substance or as a pharmaceutically acceptable salt thereof. One example is an acid addition salt of a compound having the utility of a free base. When a compound of the formula (I) contains a free base such salts are prepared in a conventional manner by treating a solution or suspension of a free base of the formula (I) with a chemical equivalent of a pharmaceutically acceptable acid. Representative examples are mentioned above.

For parenteral administration, solutions of the novel compounds of the formula (I) in sterile aqueous solution, aqueous propylene glycol, aqueous vitamin E or sesame or peanut oil may be employed. Such aqueous solutions should be suitably buffered if necessary and the liquid diluent first rendered isotonic with sufficient saline or glucose. The aqueous solutions are particularly suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art.

Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solution and various organic solvents. Examples of solid carriers are lactose, terra alba, sucrose, cyclodextrin, talc, gelatine, agar, pectin, acacia, magnesium stearate, 5 stearic acid and lower alkyl ethers of cellulose. Examples of liquid carriers are syrup, peanut oil, olive oil, phospho lipids, fatty acids, fatty acid amines, polyoxyethylene and water. Similarly, the carrier or diluent may include any sustained release material known in the art, such as glyceryl monostearate or glyceryl distearate, alone or mixed with a wax. The pharmaceutical compositions formed by combining the novel 10 compounds of the formula (I) and the pharmaceutical acceptable carriers are then readily administered in a variety of dosage forms suitable for the disclosed routes of administration. The formulations may conveniently be presented in unit dosage form by methods known in the art of pharmacy.

15 Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules or tablets, each containing a predetermined amount of the active ingredient, and which may include a suitable excipient. Furthermore, the orally available formulations may be in the form of a powder or granules, a solution or suspension in an aqueous or non-aqueous liquid, or 20 an oil-in-water or water-in-oil liquid emulsion.

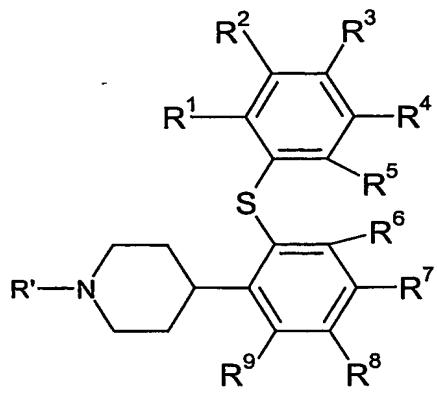

If a solid carrier is used for oral administration, the preparation may be a tablet, placed in a hard gelatine capsule in powder or pellet form or it can be in the form of a troche or lozenge.

25 The amount of solid carrier will vary widely but will usually be from about 25 mg to about 1 g.

If a liquid carrier is used, the preparation may be in the form of a syrup, emulsion, soft 30 gelatine capsule or sterile injectable liquid such as an aqueous or non-aqueous liquid suspension or solution.

The compounds of the invention are prepared by the following general methods:

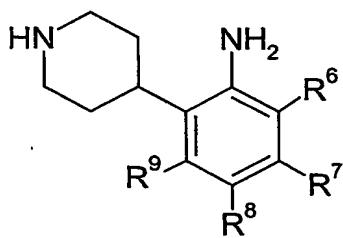

a) Deprotection or cleavage from a polymer support of a compound with formula II

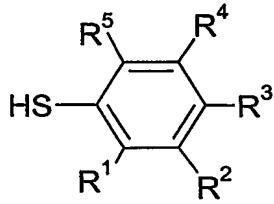

II

5 wherein R<sup>1</sup>-R<sup>9</sup> are as previously described, and R' is a carbamate or a benzyl-derived protective group. These protective groups may be linked to a solid support, for example the Wang resin-based carbamate linker.

10 b) Chemical transformation of a compound with formula III to the corresponding diazonium compound and subsequent reaction with a thiophenol of formula IV

III

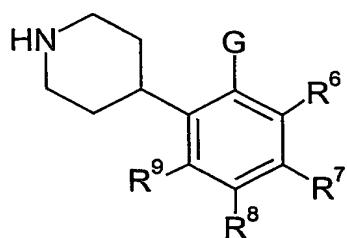

IV

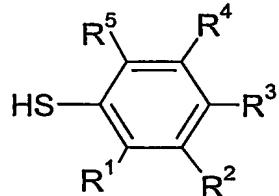

wherein R<sup>1</sup>-R<sup>9</sup> are as previously described.

c) Reacting a compound of formula V with a thiophenol of formula IV in the presence

15 of a palladium or copper catalyst

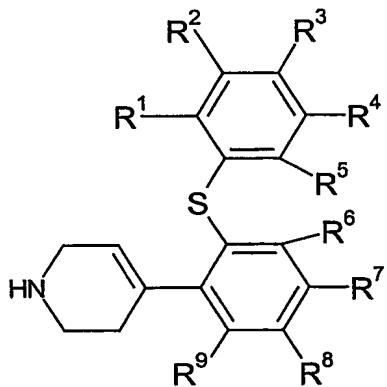

V

wherein R<sup>1</sup>-R<sup>9</sup> are as previously described, and G is a chlorine, bromine, or iodine atom or a sulfonyl ester. The sulfonyl ester is derived from the corresponding phenol by reaction with 4-methyl-benzenesulfonyl chloride, trifluoro-methanesulfonic acid anhydride, 1,1,2,2,3,3,4,4,4-nonafluoro-butane-1-sulfonyl fluoride, or related compounds; or

d) Hydrogenate the double bond in a compound of formula VI

wherein R<sup>1</sup>-R<sup>9</sup> are as described above.

The deprotection according to method a) was performed by standard techniques, known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016. The cleavage from a polymer support, such as from the Wang resin based carbamate linker, according to method a) was performed according to literature

known procedures (*Zaragoza Tetrahedron Lett.* **1995**, *36*, 8677-8678 and *Conti et al. Tetrahedron Lett.* **1997**, *38*, 2915-2918).

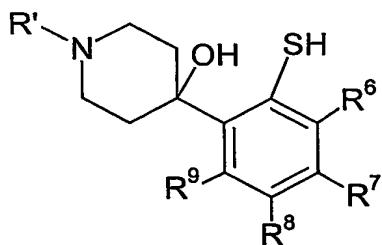

5 Compounds of formula II can be prepared by dehydrating a compound of formula VII under conditions that do not lead to cleavage of the N-R' bond followed by hydrogenation of the double bond. Alternatively, compounds of formula VII can be dehydrated with subsequent or concomitant cleavage of the N-R' bond to provide compounds of formula VI; subsequent protection of the amino group and 10 hydrogenation of the double bond then provides compounds of formula II. The reduction of the double bond may be performed using standard heterogeneous hydrogenation procedures or using homogeneous hydrogenation methods such as e.g. Crabtree's or Wilkinson's catalysts (see e.g. *Encyclopedia of Reagents for Organic Synthesis*, Paquette (Ed.), Wiley (1995), ISBN 0471936235, p. 1447 and p 1253, 15 respectively), or vice-versa. The dehydration reaction and optional deprotection of a compound of formula VII to yield compounds II or VI was performed in a similar manner as described in Palmer *et al. J. Med. Chem.* **1997**, *40*, 1982-1989.

The starting material of formula VII wherein R'=H was prepared from a compound of 20 formula VII wherein R' is a carbamate or benzyl-derived protective group by deprotection under standard conditions known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016. Compounds of formula VII wherein R' = *tert*-butyl oxo carbonyl (BOC), may be prepared as described in Palmer *et al. J.*

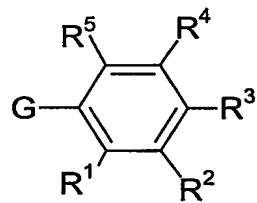

*Med. Chem.* 1997, 40, 1982-1989. Compounds VII were prepared from the corresponding properly substituted 1-bromo-phenylsulfanylbenzenes or 1-iodo-phenylsulfanylbenzenes of formula IX by metal-halogen exchange followed by addition of an appropriate electrophile of the formula VIII in a similar manner as described in Palmer et al. *J. Med. Chem.* 1997, 40, 1982-1989 or by following the procedures of Kitagawa et al. *Angew. Chem. Int. Ed.* 2000, 39, 2481-2483, or of Boymond et al. *Angew. Chem. Int. Ed.* 1998, 37, 1701-1703. Compounds VII, VIII, and IX have R<sup>1</sup>-R<sup>9</sup> and R' as previously described, and G' is a bromine or iodine atom. The properly substituted 1-bromo-phenylsulfanylbenzenes or 1-iodo-phenylsulfanylbenzenes were prepared from thiophenols IV and properly substituted aryliodides or aryl bromides according to the general procedures by Schopfer and Schlapbach *Tetrahedron* 2001, 57, 3069-3073; Bates et al. *Org. Lett.* 2002, 4, 2803-2806 and Kwong et al. *Org. Lett.* 2002, 4, 581-584.

Starting materials of formula VII can also be prepared by palladium or copper catalysed coupling of a thiophenol of formula X with a compound of formula XI according to Schopfer and Schlapbach *Tetrahedron* 2001, 57, 3069-3073; Bates et al. *Org. Lett.* 2002, 4, 2803-2806, or Kwong et al. *Org. Lett.* 2002, 4, 581-584. Compounds X can be prepared by ortholithiation of compounds IV, or by metal-halogen exchange of properly substituted 2-bromo-thiophenol or 2-iodo-thiophenol derivatives, followed by addition of electrophile of formula VIII, as exemplified in the experimental. Compounds of formula X and XI have R<sup>1</sup>-R<sup>9</sup>, R', and G as described previously. The sulfonyl esters can be derived from the corresponding phenol by reaction with 4-methyl-benzenesulfonyl chloride, trifluoro-methanesulfonic acid anhydride, 1,1,2,2,3,3,4,4,4-nonafluoro-butane-1-sulfonyl fluoride, or related compounds, as described by e.g. Cho et al. *J. Org. Chem.*, 2003, 68, 3017-3025, Arnould et al. *Tetrahedron Lett.* 1996, 37, 4523-4524, and Anderson et al. *J. Org. Chem.* 2003, 68, 9563-9573. The phenol in terms can be prepared from the analogous anisole or suitably protected phenol by standard techniques, known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016.

Starting materials of formula V and XI can be prepared by diazotation of properly substituted aniline derivatives followed by addition of either copper bromide or copper iodide as described in the textbook *Advanced Organic Chemistry* March, John Wiley & Sons (1992), ISBN 0471601802, by diazotation of the corresponding aniline derivative followed by addition of potassium iodide as described by Tunney and Stille *J. Org. Chem.* 1987, 52, 748-753, or by diazotization under the conditions reported by Doyle *et al.* *J. Org. Chem.* 1977, 42, 2426-2431 and Doyle *et al.* *J. Org. Chem.* 1980, 45, 2570-2575. Alternatively, compound V in which G is a sulfonyl ester may be derived from the corresponding phenol as described above for compound XI. The phenol in terms can be prepared from the analogous anisole or suitably protected phenol by standard techniques, known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016.

15

Compounds II can also be prepared by removal of the hydroxyl group from compounds VII using standard deoxygenation procedures (e.g. Barton-type reduction). One example of this uses activation with methyl oxalyl chloride followed by reduction with tri-n-butyltin hydride and 2-[(cyano-dimethyl-methyl)-azo]-2-methyl-propionitrile (AIBN) as described by Hansen *et al.* *Synthesis* 1999, 1925-1930. Alternatively, one can use trifluoro-acetic acid and triethyl-silane or use sodium borohydride or related reducing reagents as described in the textbook *Reductions in Organic Chemistry*, Hudlicky, ACS Monograph 188, The American Chemical Society (1996), ISBN 0841233446.

Compounds II can also be prepared by reacting compound XIII with an alkyl metal species followed by reaction with disulfide XIV, e.g. via the method reported by Carreno *et al.* *Tetrahedron*, 1991, 47, 605-614. Alternatively, the metallated species derived from compounds XIII may be quenched with compounds of formula XV according to the procedure of Marchand *et al.* *Tetrahedron* 2000, 56, 7331-7338. Compounds XIV and XV are either commercially available or can be prepared from thiophenols IV, e.g. via the methods described in the textbook *Advanced Organic Chemistry* March, John Wiley & Sons (1992), ISBN 0471601802, or by the

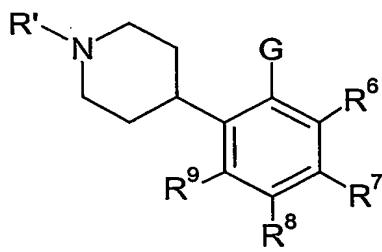

procedures reported by Barnard *J. Chem. Soc.* 1957, 4673-4675, Miller *J. Chem. Soc.* 1925, 224-233, or Evans *et al. J. Org. Chem.* 1990, 55, 2337-2344. Diazotation of compound III followed by reaction with a thiophenol IV to yield compound I can be performed by addition of the diazonium salt of the corresponding aniline to a solution of sodium salt of a thiophenol in an aqueous suspension of copper under conditions similar to those described for starting material XI below. The 10 starting material of formula III are either commercially available or can be prepared by methods analogues to those described in the literature (e.g. Berridge, M. S. *et al. J. Med. Chem.* 1993, 36, 1284-1290). Thiophenols IV are either commercially available or can be prepared according to methods described in standard works such as Houben-Weyl, Methoden der organischen Chemie (Methods of Organic Chemistry), Georg-Thieme-Verlag, Stuttgart; Organic Reactions, John Wiley & Sons, Inc. Compounds of formula II can be prepared by coupling of compounds XVIII and XI in the presence of a suitable copper or palladium catalyst as detailed for the analogous coupling of compounds XVII and XI above, followed by reduction of the double bond under the conditions outlined above for compound VI. Compounds XVIII have R<sup>6</sup>-R<sup>9</sup>, R', and R'' as defined previously. Compounds of formula XVIII for which R'' is a silyl group can be prepared from compounds of formula XX wherein R<sup>6</sup>-R<sup>9</sup>, R', and G are as defined above under the conditions reported by Arnould et al. *Tetrahedron Lett.* 1996, 37, 4523-4524 and Rane et al. *Tetrahedron Lett.* 1994, 35, 3225-3226. Compound XX can be derived from compound XVI by copper or palladium catalysed reaction with 4-(4,4,5,5-tetramethyl-[1,3,2]dioxaborolan-2-yl)-3,6-dihydro-2H-pyridine-1-carboxylic acid *tert*-butyl ester (or related boronic acid derivatives) as described by Eastwood *Tetrahedron Lett.* 2000, 41, 3705-3708 or by using the conditions for the Suzuki coupling reported by Zhuravel and Nguyen *Tetrahedron Lett.* 2001, 42, 7925-7928 as exemplified in the experimental. Alternatively, compound XX can be derived from compound XXI by directed ortho lithiation (L = hydrogen) or halide-lithium exchange (L = iodide or bromide), trapping with electrophile VIII as described for compound XXII below, followed by an elimination-

protection sequence as previously described for compounds VII. For compounds XXI

XXII

XXI

$R^6-R^9$  are as defined above while J is a methoxy group or a similarly directing hydroxyl derivative, and L is a hydrogen, bromide, or iodide atom.

Compound X may be prepared from compounds XXI by directed ortho lithiation or halide-metal exchange according to the methods reported by Palmer *et al.* *J. Med. Chem.* 1997, 40, 1982-1989, Kitagawa *et al.* *Angew. Chem. Int. Ed.* 2000, 39, 2481-2483, or Boymond *et al.* *Angew. Chem. Int. Ed.* 1998, 37, 1701-1703, or according to the procedures reported in the textbook *Organometallics in Synthesis. A Manual*, Schlosser (Ed), John Wiley & Sons, Ltd (2002), ISBN 0471984167 followed by quenching with electrophiles of the formula VIII. Upon deoxygenation or elimination-reduction as described above for compound VII, compounds XXI may be transformed into compounds XXII for which  $R^6-R^9$  are as defined above, and Q is an sulfonyl ester as described for compounds XI. Hence, compounds XXII can be transformed into compounds XVII under the conditions described for compounds XVII. The product of the reaction of the lithiated compound XXI and the electrophile VIII can be activated as a sulfonyl ester after transformation of J into a hydroxyl group by methods known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016. The resulting sulfonyl esters can be transformed into compounds X under the conditions discussed for compounds XVII followed by cleavage of the silyl protective group by methods known to the persons skilled in the art and detailed in the textbook *Protective Groups in Organic Synthesis*, Greene and Wuts, Wiley Interscience, (1991), ISBN 0471623016.

The reduction of the double bond according to method d) was generally performed by catalytic hydrogenation at low pressure (< 3 bar) in a Parr shaker apparatus. Starting material of formula VI may be prepared from compounds of formula VII.

Approximately 15 mL of the solvent was removed *in vacuo* and the residue was cooled on an icebath for 3 h to precipitate 4.10 g (59% overall) of 4-(5-fluoro-2-methoxy-phenyl)-1,2,3,6-tetrahydro-pyridine as the hydrobromic acid salt. A slurry of this compound (4.10 g, 14.2 mmol) in 1,2-dichloro-ethane (100 mL) and triethyl amine (2.3 mL) is stirred at 5 rt for 30 min before  $\text{Boc}_2\text{O}$  (2.78 g, 14.0 mmol) was added. After stirring overnight, the precipitate was filtered off, and the filtrate is washed with saturated aqueous ammonium chloride (50 mL) and dried over magnesium sulfate. The volatiles were removed *in vacuo* to yield 1.02 g (23%) of 4-(2-fluoro-6-hydroxy-phenyl)-1,2,3,6-tetrahydro-pyridine-1-carboxylic acid *tert*-butyl ester. This material was dissolved in a 10 mixture of ethyl acetate (10 mL) and ethanol (40 mL) and treated overnight with 5% Pd/C (0.1 g) and hydrogen gas (3 bar) using a Parr shaker apparatus. The catalyst was removed by filtration, and the volatiles were removed *in vacuo*. The residue (1.0 g) was suspended in 1,2-dichloro-ethane (20 mL) and treated with ethyl-di-*iso*-propyl-amine (0.53 g, 4.1 mmol) at 0 °C for 30 min before 1,1,2,2,3,3,4,4,4-nonafluorobutane-1-sulfonyl fluoride (1.12 g, 3.7 mmol) was added and stirring was continued 15 overnight at rt. The precipitate was filtered off, and the filtrate was washed with water (20 mL), dried over magnesium sulfate, and evaporated to afford the crude product. Purification by chromatography over silica gel (eluent: ethyl acetate/heptane 1:4) provided 1.27 g (65% over two steps) of 4-[2-fluoro-6-(nonafluorobutane-1-sulfonyloxy)-phenyl]-piperidine-1-carboxylic acid *tert*-butyl ester. A mixture of this 20 compound (1.27 g, 2.2 mmol) and sodium *tert*-butoxide (0.27 g, 2.9 mmol) in dry toluene (25 mL) was added to a solution of  $\text{Pd}_2\text{dba}_3$  (0.10 g, 0.11 mmol) and DPEphos (0.12 g, 0.22 mmol) in dry toluene (25 mL). Tri-*iso*-propyl-silanethiol (0.42 g, 2.2 mmol) was added, and the mixture was stirred for 5 h at 100°C. After cooling to 25 rt, the crude mixture was washed with water (50 mL), dried over magnesium sulfate, and the volatiles were removed *in vacuo*. The residue was purified by chromatography over silica gel (eluent: ethyl acetate/heptane 1:4) to yield 0.8 g (78%) of 4-(2-fluoro-6-tri-*iso*-propylsilanylsulfanyl-phenyl)-piperidine-1-carboxylic acid *tert*-butyl ester.

A mixture of 2-bromo-4-fluoro-1-methoxy-benzene (36.2 g, 176.7 mmol) and dry THF (25 mL) was added to a cooled solution of *n*-butyl lithium (2.1 M in hexane, 101 mL, 212.1 mmol) in dry THF (100 mL) at a rate so that the temperature was maintained below -40 °C. The mixture was stirred for 30 min at -78 °C before 4-oxo-piperidine-1-carboxylic acid ethyl ester (30.4 g, 176.7 mmol) was added at a rate so that the temperature was maintained below -50 °C. The resulting mixture was allowed to warm to rt and stirring was continued overnight. Water (100 mL) and ethyl acetate (100 mL) was added. The organic layer was washed with saturated aqueous ammonium chloride (100 mL), dried over magnesium sulfate, and evaporated *in vacuo* to afford 52.3 g (>95%) of 4-(5-fluoro-2-methoxy-phenyl)-4-hydroxy-piperidine-1-carboxylic acid ethyl ester, which was sufficiently pure for the next step.

Chloro-oxo-acetic acid methyl ester (1.37 g, 11.2 mmol) was added to a stirred solution of 1-*tert*-butoxycarbonyl-4-[2-(4-chloro-phenylsulfanyl)-5-trifluoromethyl-phenyl]-piperidine-4-ol (0.98 g, 2.0 mmol) and dimethyl-pyridin-4-yl-amine (DMAP, 0.44 g, 3.6 mmol) in dry acetonitrile (6.4 mL) at 0 °C under argon. The reaction mixture was allowed to reach room temperature and then stirred overnight. Ethyl acetate (40 mL) was added and the precipitated salts were removed by filtration through celite. The organic phase was washed with saturated aqueous sodium bicarbonate (40 mL), saturated aqueous sodium chloride (40 mL), and dried over magnesium sulfate. The volatiles were evaporated off, and the crude material was dried *in vacuo*. This material was dissolved in dry toluene (13 mL) under argon. Tri-*n*-butyl tin hydride (0.81 g, 3.0 mmol) and 2-[(cyano-dimethyl-methyl)-azo]-2-methyl-propionitrile (AIBN, 82 mg, 0.5 mmol) were added. The solution was stirred under argon at 90 °C for 3.5 h. The solvent was evaporated, and the crude material was purified by chromatography on silica gel (eluent: ethyl acetate/ heptane 1:9) to produce 4-[2-(4-chloro-phenylsulfanyl)-5-trifluoromethyl-phenyl]-piperidine-1-carboxylic acid *tert*-butyl ester as a clear oil (0.77 g, 82%). This oil was dissolved in methanol (8 mL) and hydrogen chloride in diethyl ether (2M, 8 mL) was added at 0°C. The reaction mixture was allowed to warm to room temperature and stirred overnight. ### Method C:

**3a1,** *4-[2-(4-Trifluoromethyl-phenylsulfanyl)-phenyl]-piperidine trifluoro-acetic acid salt*

A mixture of 4-(2-tri-*iso*-propylsilylphenylsulfanyl-phenyl)-piperidine-1-carboxylic acid *tert*-butyl ester (38 mg, 0.085 mmol) and 1-iodo-4-trifluoromethyl-benzene (23 mg, 0.085 mmol) was dissolved in dry degassed toluene (0.3 mL).  $\text{Pd}_2\text{dba}_3$  (1 mg) and DPEphos (1 mg) dissolved in dry toluene (0.2 mL) were added. To this solution were

added potassium *tert*-butoxide (10 mg) and tetra-*n*-butyl ammonium fluoride (TBAF, 1M in THF, 0.1 mL, 0.1 mmol) and the reaction mixture was stirred at 110°C for 1 h under argon. The solution was filtered and the solvent was evaporated off. The crude product was purified by chromatography on silica gel (eluent: An increasing amount (0-100%) of ethyl acetate in heptane) to produce 4-[2-(4-trifluoromethyl-phenylsulfanyl)-phenyl]-piperidine-1-carboxylic acid *tert*-butyl ester (**3a1**) as a clear oil (22 mg, 59% yield). This material was dissolved in methanol (1 mL) and hydrogen chloride in diethyl ether (2M, 1mL) was added and the solution was stirred overnight at rt. The solvent was evaporated of and the crude product was purified by HPLC (containing 0.1% TFA in the standard eluent) to produce 4-[2-(4-trifluoromethyl-phenylsulfanyl)-phenyl]-piperidine **3a1** as the trifluoro-acetic acid salt. Yield: 3.2 mg (8% overall). LC/TOF (m/z) 338.0 ( $\text{MH}^+$ ); RT = 2.29 min; purity (UV, ELSD): 98.3%, 97.1%.

**4a, 4-[2-(4-Hydroxymethyl-phenylsulfanyl)-phenyl]-piperidine hydrochloric acid salt**

Concentrated aqueous hydrochloric acid (38 mL) was added to a stirred solution of 1-*tert*-butoxycarbonyl-4-[2-(4-methoxycarbonyl-phenylsulfanyl)-phenyl]-piperidine-4-

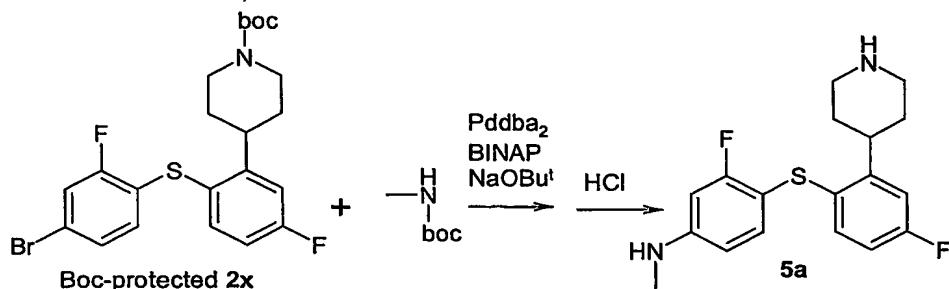

ol (1.25 g, 4 mmol) in acetic acid (12 mL). The solution was refluxed for 6 h, cooled to room temperature and then quenched by adding ice/water (100 mL). The solution was extracted with ethyl acetate (3x100 mL). The combined organic phases were dried over magnesium sulfate and the solvents were evaporated off. This crude material was dissolved in methanol (25 mL) and hydrogen chloride in diethyl ether

(2M, 25 mL) was added. The mixture was refluxed for 12 h and the solvents were evaporated off. The residue was partitioned between aqueous sodium hydroxide (2M, 100 mL) and ethyl acetate (2x100 mL). The ethyl acetate phase was dried over

25 magnesium sulfate and the solvents were evaporated off. The residue was purified by column chromatography (silica gel, 10% ethyl acetate/hexanes) to yield compound 4a (1.0 g, 70%).

magnesium sulfate and the solvents were evaporated off. This material (4-[2-(4-methoxycarbonyl-phenylsulfanyl)-phenyl] piperidine, 0.98 g, 3 mmol) was dissolved in methylene chloride (25 mL) and Boc<sub>2</sub>O (0.66 g, 3 mmol) was added. The reaction was stirred for 2 h and Crabtree's catalyst (0.13 g, 0.16 mmol) was added. The reaction mixture was treated with hydrogen gas (1.5 bar) overnight on a Parr shaker apparatus. The crude mixture was filtered through a plough of silica gel, and the filtrate was concentrated *in vacuo*. The residue was purified by chromatography on silica gel (eluent: ethyl acetate/heptane 1:2) to produce a solid (0.495 g). 0.285 g of this material was refluxed for 1 h in a mixture of hydrogen chloride in diethyl ether (2M, 25 mL) and methanol (25 mL). The solvent was evaporated off and aqueous sodium hydroxide (2M, 50 mL) and ethyl acetate (2x50 mL) were added. The combined organic phases were dried over magnesium sulfate, and the solvent was evaporated off. This material (0.15 g) was dissolved in THF (25 mL) and lithium aluminium hydride (50 mg, 1.32 mmol) was added. The reaction was stirred overnight, before the reaction was quenched with water (0.1 mL) and saturated aqueous sodium hydroxide (0.2 mL). After stirring for 30 min, water (1 mL) was added, and the precipitate was filtered off. The organic filtrate phase was dried over magnesium sulfate, and the solvent was evaporated off. The crude product was purified by chromatography on silica gel (eluent: ethyl acetate/triethyl amine/methanol 8:1:2) to produce the free base which was precipitated as the hydrochloric acid salt from hydrogen chloride in diethyl ether (2M, 5 mL). Yield: 12.6 mg. LC/MS (m/z) 300.0 (MH<sup>+</sup>); RT = 1.79; purity (UV, ELSD): 96.8%, 88%.

#### Measurements of [ $^3$ H]-5-HT uptake into rat cortical synaptosomes.

Whole brains from male Wistar rats (125-225 g), excluding cerebellum, are homogenized in 0.32 M sucrose supplemented with 1mM nialamid with a glass/teflon homogenizer. The homogenate is centrifuged at 600 x g for 10 min at 4 °C. The pellet is discarded and the supernatant is centrifuged at 20.000 x g for 55 min. The final pellet is homogenized (20 sec) in this assay buffer (0.5 mg original tissue/well). Test compounds (or buffer) and 10 nM [ $^3$ H]-5-HT are added to 96 well plates and shaken briefly. Composition of assay buffer: 123 mM NaCl, 4.82 mM KCl, 0.973 mM CaCl<sub>2</sub>, 1.12 mM MgSO<sub>4</sub>, 12.66 mM Na<sub>2</sub>HPO<sub>4</sub>, 2.97 mM NaH<sub>2</sub>PO<sub>4</sub>, 0.162 mM EDTA, 10 mM glucose and 1 mM ascorbic acid. Buffer is oxygenated with 95% O<sub>2</sub>/5% CO<sub>2</sub> for 10 min at 37 °C and pH is adjusted 7.4. The incubation is started by adding tissue to a final assay volume of 0.2 mL. After 15 min incubation with radioligand at 37 °C, samples are filtered directly on Unifilter GF/C glass fiber filters (soaked for 1 hour in 0.1% polyethylenimine) under vacuum and immediately washed with 3 x 0.2 mL assay buffer. Non-specific uptake is determined using citalopram (10 µM final concentration). Citalopram is included as reference in all experiments as dose-response curve.

Preferred compounds of the present invention exhibit serotonin reuptake inhibition below 200 nM (IC<sub>50</sub>) in the assay above. More preferred are the compounds which exhibit inhibition below 100 nM and most preferably below 50 nM.

**[<sup>3</sup>H]Mesulergine binding to 5-HT<sub>2C</sub> receptors.**

Cell lines expressing 10-20 pmol/mg protein human 5-HT<sub>2C</sub>-vsv receptors (Euroscreen) were harvested in ice-cold 50 mM Tris pH 7.7 buffer containing 125 mM NaCl and stored at -80 ° C. On the day of the experiment cells were quickly 5 thawed and homogenized in 50 mM Tris pH 7.7 using an Ultra-Thurax. Aliquots consisting of 6-30 µg protein, [<sup>3</sup>H]Mesulergine (1 nM) and testsubstance were incubated for 30 min at 37 °C. Total binding was determined using assay buffer (50 mM Tris pH 7.7) and non-specific binding was defined in the presence of 100 µM 5-HT. Bound and free [<sup>3</sup>H]Mesulergine was separated by vacuum filtration on GF/B 10 filters (pre-soaked in 0.1% PEI for ½ hour) and counted in a scintillation counter.

**5-HT<sub>2C</sub> receptor efficacy as determined by fluorometry.**

This assay was carried out as described by Porter *et al. British Journal of Pharmacology* 1999, 128, 13 with the modifications described below. 2 days before 15 the experiment CHO cells expressing 10-20 pmol/mg protein human 5-HT<sub>2C</sub>-vsv receptors (Euroscreen) were plated at a density sufficient to yield a mono-confluent layer on the day of the experiment. The cells were dye loaded (Ca<sup>2+</sup>-kit from Molecular Devices, and according to their instructions) at 37 °C in a 5% CO<sub>2</sub> incubator at 95% humidity. Lazer intensity was set to a suitable level to obtain basal 20 values of approximately 8000 RFUs. The variation in basal fluorescence was less than 10%. EC<sub>50</sub> values were assessed using increasing concentrations of test compound covering 3 decades. IC<sub>50</sub> values were assessed challenging the EC<sub>85</sub> of 5-HT with concentrations covering 3 decades of test substances. Ki values were calculated using Cheng-Prusoff equation.
